

## Product Requirements Document

We need to design a mobile fitness tracking application for iOS and Android users.

The app should track steps, calories burned, and distance traveled throughout the day. It must support multiple user profiles so families can share one device.

All data needs to sync with cloud storage for backup. We have a budget of \$5000 and need this completed within 3 months.

The development should use React Native framework to support both platforms.

We expect a working prototype, complete technical documentation, and full source code as deliverables.
